Period for Reply -- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 03 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 07/06/2009.
2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1, 3-24, 26-31, 47-52 and 57-61 is/are pending in the application.
4a) Of the above claim(s) _____ is/are withdrawn from consideration.
5) ☐ Claim(s) _____ is/are allowed.
6) ☒ Claim(s) 1, 3-24, 26-31, 47-52 and 57-61 is/are rejected.
7) ☐ Claim(s) _____ is/are objected to.
8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
10) ☒ The drawing(s) filed on 18 September 2001 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
3) ☐ Information Disclosure Statement(s) (PTO/SB/08)
Paper No(s)/Mail Date _____
4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____
5) ☐ Notice of Informal Patent Application
6) ☐ Other: _____

DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 07/06/2009 has been entered.

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1 and 3-19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tsumpes (US 6,442,241 B1).

Re claim 1, Tsumpes teaches a security system (fig. 1) comprising: a security gateway (12 of fig. 1, the controller is considered as a security gateway) located at a premises (11 of fig. 1, sensors are obviously alarm and video systems), wherein the security gateway (12 of fig. 1) is operable to detect an alarm condition (col. 6, lines 32-37) and to record video of at least a portion of the premises relating to the alarm condition, said video hereinafter referred to as an Alarm Video (Alarm inputs, 11 of fig. 1, wherein alarm inputs 11 are video that would obviously be

considered as alarm video; col. 8, lines 45-50, note the digital data packet DDP and wireless or Internet communication network also enables the present system to provide video and/or audio transmissions from the monitored device or premises to the central monitoring station due to the bandwidth capabilities of most digital data packet networks);

a security system server (13 of fig. 1) operatively coupled to the security gateway through a first network (19 of fig. 1) and a second network (20 of fig. 1);

wherein the security gateway is to transfer the Alarm Video to the security system server in substantially real time through only the first network (*col. 4, line 64-col. 5, line 33, transmission of notification alarms between the security gateway and the security system server, 12 and 13 of fig. 1; col. 8, lines 45-50, note the digital data packet DDP and wireless or Internet communication network also enables the present system to provide video and/or audio transmissions from the monitored device or premises to the central monitoring station due to the bandwidth capabilities of most digital data packet networks, therefore one skill in the art would used this suggestion to design the system for transmitting the video through only the first network, 19 of fig. 1);*

wherein the security gateway (12 of fig. 1) is further configured to notify the security system server of the alarm condition through the first network (19 of fig. 1) with notifying the security system server of the alarm condition through the second network (20 of fig. 1, col. 5, lines 19-23, note DDP is transmitted via the wireless transceiver (19 of fig. 1) and radio frequency RF transceiver (20 of fig. 1)), and

wherein the security system server thereby receives the Alarm Video and two notifications of the alarm condition from the security gateway (the central monitoring station

security system server receives one or more alarms from the premises, col. 1, lines 15-25, and Digital Data Packet that include the Alarm Video, col. 8, lines 45-50).

It is noted that Tsumpes teaches transmitting notifications of the alarm condition through first network (19 of fig. 1) and second network (20 of fig. 1); wherein Tsumpes suggests one of the major benefits of the present pre-programmed and automated *parallel* and *redundant* contact and notification system and method is that it provides expeditious and efficient handling of time sensitive events and significantly reduces response time in emergency situations (col.8, lines 18-23).

The disclosure above fairly suggests the communications networks (19 and 20 of fig. 1) are in parallel and redundant (note the communications networks are in parallel that would obviously transmit the notifications simultaneously, and the communications networks are in redundant that would obviously transmit the notification via the first communication network or the second communication network as back-up network, or redundantly transmit the notification through first and second networks substantially at the same time) for substantially simultaneous transmitting notifications of the alarm condition to the central monitoring system (13 of fig. 1). Doing so would provide many benefits including reduction of false alarms and false dispatches.

Re claims 3-12, Tsumpes further teaches the first network is an IP network, an Ethernet-based network, Internet, a frame relay network, a hybrid-fiber coaxial network, a fiber-optic network, a DSL network, an ATM network, a high-speed fixed wireless network, a high-speed mobile communications network (DDP, DMTF, WIRELESS of fig. 1; One skill in the art would use the well known and suitable network that are available in the market).

Re claim 13, Tsumpes further teaches the second network comprises a public switched telephone network, a fixed wireless network, a mobile communications network (DDP of fig. 1).

Re claim 16, Tsumpes further teaches wherein the security gateway is further operable to record audio from at least a portion of the premises relating to the alarm condition, said audio referred to hereinafter as Alarm Audio, and wherein the security gateway is further configured to transmit said Alarm Audio to the security system server through the second network in substantially real time (col. 8, lines 45-50).

Re claims 17 and 18, Tsumpes further teaches wherein the security system server is configured to provide notification of the alarm condition to a public safety agency (user or further security services fig. 1).

Re claim 19, Tsumpes further teaches wherein the security gateway is further operable to record audio from at least a portion of the premises relating to the alarm condition, said audio referred to hereinafter as Alarm Audio, and wherein the security gateway is further configured to transmit said Alarm Audio to the security system server through the first network in substantially real time (col. 8, lines 45-50).

3. Claims 47-49 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tsumpes (US 6,442,241 B1) in view of unpatentable over Lemons (US 6,504,479).

Re claims 47-49, Tsumpes does not particularly teach wherein the security gateway is further configured to detect if connectivity with the security system server through the first network is lost and notify the security system server by sending a notification signal through the second network of the loss of connectivity through the first network; wherein the security

gateway is further configured to notify the security system server in the event that connectivity with the security system server through the first network is lost while the security gateway is disarmed and the security gateway is armed before connectivity with the security system server through the first network is restored as claimed.

Re claims 47-49, Lemons teaches wherein the security gateway (12 of fig. 1) is further configured to detect if connectivity with the security system server through the first network (36 of fig. 1, note the backup communications channel, 50 of fig. 1, is connected when the first network, 36 of fig. 1, is interrupted) is lost and notify the security system server by sending a notification signal through the second network of the loss of connectivity through the first network (Note in case the channel 36 is broken, interrupted, or otherwise impaired, the controller 200 is connected to the monitoring center 38 via the CTE252 and the communications channel 50, col. 9, lines 51-61); wherein the security gateway (12 of fig. 1) is further configured to notify the security system server (38 of fig. 1) in the event that connectivity with the security system server through the first network is lost (e.g. 36 of fig. 1, the channel 36 is interrupted, col. 9, lines 51-61) while the security gateway is disarmed (col. 5, lines 5-13) and the security gateway is armed before connectivity with the security system server through the first network is restored (note the channel 36 is protected before sending video and alarm condition to the server, 38 of fig. 1).

Taking the teachings of Tsumpes and Lemons as a whole, it would have been obvious to one of ordinary skill in the art to modify the teachings of Lemons into the security system of Tsumpes for reducing redundancies in the control of all of the systems, and provides a common

communications channel for alarm reporting and exchange of information with a remote monitoring center.

4. Claims 20-24, 26-31, and 50-52 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lemons (US 6,504,479) in view of Tsumpes (US 6,442,241 B1) and further in view of Kung et al. (US 6,826,173).

Re claim 20, Lemons teaches a security system (fig. 1) comprising: a security gateway (12 of fig. 1) located at a premises (12a and 12b of fig. 8), wherein the security gateway (12 of fig. 1) is operable to detect an alarm condition and to record video of at least a portion of the premises relating to the alarm condition to form an alarm video (16, 18, 20, 22 of fig. 1; see fig. 3), wherein the security gateway (12 of fig. 1) further comprises a network interface (14 of fig. 1, Note the connections between the components (24, 26, 28, 30, 34, 56 of fig. 1), and wherein the network interface is configured to connect the security gateway a head-end through out a first network (col. 6, line 62-col. 7, lines 50, Note the connections between components are considered as the first network; a network is a fabric or structure of cords or wires that cross at regular intervals and are knotted or secured at the crossings, a system of lines or channels resembling a network, an interconnected or interrelated chain, group, or system, or a system of computers, peripherals, terminals, and databases connected by communications lines);

a security system server (38 of fig. 1) configured to connect to the interface (34 of fig. 1) through a second network (36 of fig. 1), wherein the security gateway (12 and 14 of fig. 1) is configured to notify the security system server of the alarm condition through the second network (36 of fig. 1) and to transfer the alarm Video to the security system server in

substantially real time (col. 7, lines 25-50) only through the second network (36 of fig. 1, the alarm condition and alarm video is transmitted to the server using the network as the second network (36 of fig. 1)); wherein the security gateway (12, 14 of fig. 1) is operatively coupled to the security system server (38 of fig. 1) through a third network (50 of fig. 1) for redundant transmitting the alarm condition, the security gateway being further configured to notify the security system server of the alarm condition through the third network (col. 4, line 66 through col. 5, lines 14).

Lemons suggests that any communications channel available (36 and 50 of fig. 1) such as a hybrid-fiber coaxial network; a fiber-optic network, an ATM network, and a high-speed mobile communications network, that connects between the gateway (12 of fig. 1) is used in the security system, so this is evidence to one skilled in the art to modify any conventional network into the security system of Lemons.

It is noted that Lemons does not particularly teach simultaneously notifying the alarm to the security server of the alarm through the second network and the third network, and wherein the security system server is configured to receive a notification of the alarm condition through the second network and to receive another notification of the alarm condition through the third network as claimed.

Tsumpes teaches simultaneously notifying the alarm to the security server (13 of fig. 1) of the alarm through the second network (19 of fig. 1) and the third network (20 of fig. 1), and wherein the security system server (13 of fig. 1) is configured to receive a notification of the alarm condition through the second network (19 of fig. 1) and to receive another notification of the alarm condition through the third network (20 of fig. 1; *note* one of the major benefits of the

present pre-programmed and automated **parallel** and **redundant** contact and notification system and method is that it provides expeditious and efficient handling of time sensitive events and significantly reduces response time in emergency situations (col.8, lines 18-23). The disclosure above fairly suggests the communications networks (19 and 20 of fig. 1) are in parallel and redundant (note the communications networks are in parallel that would obviously transmit the notifications simultaneously, and the communications networks are in redundant that would obviously transmit the notification via the first communication network or the second communication network as back-up network, or redundantly transmit the notification through first and second networks substantially at the same time).

Therefore, taking the teachings of Lemons and Tsumpes as a whole, it would have been obvious to one of ordinary skill in the art to modify the teachings of Tsumpes, the automated parallel and redundant contact to a user notification one or more alarms, into the security system of Lemons for one of the major benefits of the automated parallel and redundant contact and notification system and method is that it provides expeditious and efficient handling of time sensitive events and significantly reduces response time in emergency situations.

The combination of Lemons and Tsumpes teaches all limitation above, except the interface of the security gateway connects to a cable head-end through the first network by a hybrid-fiber-coaxial network as claimed.

However, Kung teaches a security gateway (102 of fig. 1) connects to a cable head-end (115 of fig. 1) through a first network (112 of fig. 1) by a hybrid-fiber-coaxial network (col.5, line 44 through col. 6, line 9).

Therefore, taking the teachings of Lemons, Tsumpes, and Kung as a whole, it would have been obvious to one of ordinary skill in the art to incorporate the cable head-end (115 of fig. 1) through the first network (112 of fig. 1) by the hybrid-fiber-coaxial network (col. 5, line 44 through col. 6, line 9) of Kung into the communications channel (34 and 36 of fig. 1) of the combined security of Lemons and Tsumpes for the same purpose of transmitting the alarm video and alarm condition from the security gateway to the security server. Doing so would provide improved performance and quicker response time for an individual user.

Re claims 21-24, 26-28, Lemons further teaches the first network is an IP network (a network in which transmission of information is done using IP protocol; e.g. Internet network), an Ethernet-based network (LAN), the Internet, a frame relay network (a frame relay is a telecommunication service designed for cost-efficient data transmission for intermittent traffic between local area networks (*LANs*) and between end-points in a wide area network (*WAN*); a DSL network; a high-speed fixed wireless network (36 of fig. 1; see col. 5, lines 18-23); Lemons further suggests any communications channel available (36 and 50 of fig. 1) such as a hybrid-fiber coaxial network; a fiber-optic network, an ATM network, and a high-speed mobile communications network, that connects between the gateway (12 of fig. 1) is used in the security system; and wherein the second network comprises a public switched telephone network and a fixed wireless network (col. 5, lines 25-30).

Re claim 29, Lemons further teaches wherein the security gateway is further operable to record audio from at least a portion of the premises relating to the alarm condition, said audio referred to hereinafter as alarm audio, alarm video, and wherein the security gateway is further configured to transmit said alarm audio and video to the security system server through the

second network in substantially real time (102, 108, 110, 112, 114, 116, and 118 of fig. 2; alarm 144 and 160 of fig. 3).

Re claims 30 and 31, Lemons further teaches wherein the security system server is configured to provide notification of the alarm condition to a public safety agency (42, 44, 46, and 48 of fig. 1).

Re claims 50-52, Lemons further teaches wherein the security gateway (12 of fig. 1) is further configured to detect if connectivity with the security system server through the first network (36 of fig. 1, note the backup communications channel, 50 of fig. 1, is connected when the first network, 36 of fig. 1, is interrupted) is lost and notify the security system server by sending a notification signal through the second network of the loss of connectivity through the first network (Note in case the channel 36 is broken, interrupted, or otherwise impaired, the controller 200 is connected to the monitoring center 38 via the CTE252 and the communications channel 50, col. 9, lines 51-61); wherein the security gateway (12 of fig. 1) is further configured to notify the security system server (38 of fig. 1) in the event that connectivity with the security system server through the first network is lost (e.g. 36 of fig. 1, the channel 36 is interrupted, col. 9, lines 51-61) while the security gateway is disarmed (col. 5, lines 5-13) and the security gateway is armed before connectivity with the security system server through the first network is restored (note the channel 36 is protected before sending video and alarm condition to the server, 38 of fig. 1).

5. Claims 57-61 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lemons (US 6,504,479) in view of Menard (US 6,667,688).

Re claims 57-61, Lemons teaches a security system (fig. 1) comprising: a security gateway located at a premises (12 of fig. 1), wherein the security gateway is operable to detect an alarm condition and to record video of at least a portion of the premises relating to the alarm condition, the video hereinafter referred to as an Alarm Video (16, 18, 20, 22, and 14 of fig. 1);

a security system server (38 of fig. 1) operatively coupled to the security gateway (12 of fig. 1) through a first network (36 of fig. 1), wherein the security gateway is configured to notify the security system server of the alarm condition and to transfer the Alarm Video to the security system server through the first network in substantially real time and wherein the security system server is remotely located relative to the security gateway (160 of fig. 3);

a monitoring center (48 of fig. 1) for monitoring video images, display alarms, display of contact data and information, wherein the video image and alarms received through network (36 or 50 of fig. 1), and any conventional channel communication networks include standard telephone service, ISDN, DSL, Internet, dedicated cable, local area network, wide area network, wireless, or any communications channel available to connect between the promise and server or other (col. 5, lines 15-22).

However, Lemons does not particularly teach the monitoring center operatively coupled to said security gateway through a second network, wherein the security gateway is configured to notify the monitoring center of the alarm condition without transferring the Alarm Video through the second network, wherein the monitoring center is remotely located relative to the security gateway and the security system server and wherein the monitoring center is further operably coupled to the security system server; and wherein the monitoring center is configured to notify the security system server of the alarm condition; wherein the monitoring center is operatively

coupled to the security system server through a third network and wherein the monitoring center is configured to notify the security system server of the alarm condition through the third network; wherein the security system gateway is configured to notify the security gateway of the alarm condition through the first network substantially simultaneously with notifying the monitoring station of the alarm condition through the second network; wherein the monitoring center is operatively coupled to the security system server through the first network and wherein the monitoring center is configured to notify the security system server of the alarm condition through the first network; wherein the security system gateway is configured to notify the security gateway of the alarm condition through the first network substantially simultaneously with notifying the monitoring station of the alarm condition through the second network as specified in claims 57-61.

Menard teaches a monitoring center (30 and 40 of fig. 1, Note user communication device is considered as monitoring center) operatively coupled to said security gateway (10 of fig. 1) through a second network (Path A of fig. 1), wherein the security gateway (10 of fig. 1) is configured to notify the monitoring center of the alarm condition without transferring the Alarm Video through the second network (alarm transmission of fig. 1), wherein the monitoring center (30 and 40 of fig. 1) is remotely located relative to the security gateway (10 of fig. 1) and the security system server (20 of fig. 1) and wherein the monitoring center is further operably coupled to the security system server (30, 40, and 20 of fig. 1); and wherein the monitoring center is configured to notify the security system server of the alarm condition (Path D carries the same alarm transmission as Path A of fig. 1); wherein the monitoring center (30 and 40 of fig. 1) is operatively coupled to the security system server through a third network (Path D of fig.

1) and wherein the monitoring center (30 of fig. 1) is configured to notify the security system server of the alarm condition through the third network (Path C of fig. 1); wherein the security system gateway (10 of fig. 1) is configured to notify the security gateway of the alarm condition through the first network substantially simultaneously with notifying the monitoring station of the alarm condition through the second network (Path A and Path B of fig. 1, Note simultaneous alarm transmission); wherein the monitoring center (30 and 40 of fig. 1) is operatively coupled to the security system server (Path D is the same Path A of fig. 1) through the first network and wherein the monitoring center is configured to notify the security system server of the alarm condition through the first network (Path A as Path D); wherein the security system gateway (10 of fig. 1) is configured to notify the security gateway (Alarm system) of the alarm condition through the first network substantially simultaneously with notifying the monitoring station of the alarm condition through the second network (Path A of fig. 1).

Therefore, taking the teachings of Lemons and Menard as a whole, it would have been obvious to one of ordinary skill in the art to modify the first and second networks (Path A and Path B of fig. 1) of Menard into the security system of Lemons for automatically transmitting notification of a detected alarm to the user. Doing so would save cost and simplify the security system.

6. Claims 20-24, 26-31, 47-52, and 57-61 are rejected under 35 U.S.C. 103(a) as being unpatentable over Saylor (US 6,400,265) in view of Kung et al. (US 6,826,173), and further in view of Menard et al. (US 6,667,688).

Re claim 20, Saylor teach a security system (fig. 1) comprising:

a security gateway located at premises (110, 120, 112, 122, 114, and 124 of fig. 1), wherein the security gateway is operable to detect an alarm condition and to record video of at least a portion of the premises relating to the alarm condition, said video hereinafter referred to as an Alarm Video (120, 122, and 124 of fig. 1),

wherein the security gateway further comprises a network interface (100 of fig. 1, wherein the connections between the property (110 of fig. 1) and a security server (130 of fig. 1) throughout the network (100 of fig. 1)), and

wherein the network interface is configured to connect the security gateway to a cable head-end through a first network (Note the network (100 of fig. 1) between the property (110 of fig. 1) and the security server (130 of fig. 1);

a security system server (130 of fig. 1) configured to connect to the cable head-end through a second network (150 of fig. 1, Note alert notification is sent to the user and to the security system server through out the Internet), wherein the security gateway (110 of fig. 1) is configured to notify the security system server (130 of fig. 1) of the alarm condition through the second network (150 of fig. 1) and to transfer the Alarm Video to the security system server in substantially real time through only the second network (150 of fig. 1, col. 4, lines 44-47, the alarm condition and alarm video would obviously be transmitted through the second network, 150 of fig. 1);

wherein the security gateway (110 of fig. 1) is operatively coupled to the security system server (130 of fig. 1) through a third network (152 of fig. 1; Note alert notification is transmitted to the user and to the security system server through POTS (cable)), the security gateway (110 of

fig. 1) being further configured to notify the security system server (130 of fig. 1) of the alarm condition through the third network (152 of fig. 1); and

wherein the security gateway (110 of fig. 1) is configured to notify the security system server of the alarm condition through the second network substantially simultaneously (*Note a system and method for monitoring a security system by using video images where a wireless communication system may be used to automatically inform an owner and other authorized entities in a manner predetermined by the user when alarm situations and/or alarm worthy situations occur, this suggests the security gateway simultaneously transmits the alarm notification to the second and third networks*) with notifying the security system server (130 of fig. 1) of the alarm condition through the second and third networks (150 and 152 of fig. 1).

wherein the security system server is configured to receive the alarm video (see fig. 10, wherein the video image is transmitted from the camera to the server)

It is noted that Saylor suggests that phone, POTS, cable, DSL, and other combinations may be implemented (col. 6, lines 21-33), so this is evidence to one skill in the art to modify any conventional and suitable connection between the security server and the security gateway of Saylor.

However, Saylor does particularly teach the first network is a hybrid-fiber- coaxial network as claimed.

Kung teaches a security gateway (102 of fig. 1) connects to a cable head-end (115 of fig. 1) through a first network (112 of fig. 1) by a hybrid-fiber-coaxial network (col.5, line 44 through col. 6, line 9).

Therefore, taking the teachings of Saylor and Kung as a whole, it would have been obvious to one of ordinary skill in the art to incorporate the cable head-end (115 of fig. 1) through the first network (112 of fig. 1) by the hybrid-fiber-coaxial network (col.5, line 44 through col. 6, line 9) of Kung into the networks of Saylor for enhancing the functionality of components in the broadband network. Doing so would allow the system to provide ease of maintenance, control, and re-configuration as well as a reduction in cost due to shared functionality.

It is noted that Saylor does not particularly wherein the security system server is configured to receive a notification of the alarm condition through the second network and to receive another notification of the alarm condition through the third network as claimed.

Tsumpes teaches simultaneously notifying the alarm to the security server (13 of fig. 1) of the alarm through the second network (19 of fig. 1) and the third network (20 of fig. 1), and wherein the security system server (13 of fig. 1) is configured to receive a notification of the alarm condition through the second network (19 of fig. 1) and to receive another notification of the alarm condition through the third network (20 of fig. 1; *note* one of the major benefits of the present pre-programmed and automated **parallel** and **redundant** contact and notification system and method is that it provides expeditious and efficient handling of time sensitive events and significantly reduces response time in emergency situations (col.8, lines 18-23). The disclosure above fairly suggests the communications networks (19 and 20 of fig. 1) are in parallel and redundant (note the communications networks are in parallel that would obviously transmit the notifications simultaneously, and the communications networks are in redundant that would obviously transmit the notification via the first communication network or the second

communication network as back-up network, or redundantly transmit the notification through first and second networks substantially at the same time).

Therefore, taking the teachings of Saylor, Kung, and Tsumpes as a whole, it would have been obvious to one of ordinary skill in the art to modify the teachings of Tsumpes, the automated parallel and redundant contact to a user notification one or more alarms, into the security system of Saylor and Kung for one of the major benefits of the automated parallel and redundant contact and notification system and method is that it provides expeditious and efficient handling of time sensitive events and significantly reduces response time in emergency situations.

Re claim 21, Saylor teaches wherein the second network is a dedicated bandwidth network (Internet 150 of fig. 1).

Re claim 22, Saylor further teaches wherein the second network comprises a frame relay network (230 of fig. 1).

Re claim 23, Saylor further teaches wherein the second network comprises an ATM network (other methods are considered as an ATM network, col. 4, lines 46-47).

Re claim 24, Saylor further teaches wherein the second network comprises a managed IP connection having quality of service (TCP/IP connection of fig. 2).

Re claim 26, Saylor further teaches wherein the third network comprises a public switched telephone network (POTS 152 of fig. 1).

Re claim 27, Saylor further teaches wherein the third network comprises a fixed wireless network (fig. 2).

Re claim 28, Saylor further teaches wherein the third network comprises a mobile communications network (col. 4, line 46).

Re claim 29, Saylor further teaches wherein the security gateway is further operable to record audio from at least a portion of the premises relating to the alarm condition, said audio referred hereinafter as Alarm Audio, and wherein the security gateway is further configured to transmit said Alarm Audio to the security system server through the second network in substantially real time (col. 8, lines 50-65).

Re claim 30, Saylor further teaches wherein the security system server (130 of fig. 1) is configured to provide notification of the alarm condition to a public safety agency (160f-160N of fig. 1; see also 164 of fig. 1).

Re claim 31, Saylor further teaches wherein the security system server is further configured to provide the Alarm Video to the public safety agency (video 110 of fig. 1).

Re claim 47, Saylor further teaches wherein the security gateway is further configured to detect if connectivity with the security system server through the first network is lost and notify the security system server through the second network of the loss of connectivity through the first network (col. 6, lines 50-55).

Re claim 48, Saylor further teaches wherein the security gateway is further configured to notify the security system server in the event that connectivity with the security system server through the first network is lost while the security gateway is disarmed and the security gateway is armed before connectivity with the security system server through the first network is restored (col. 6, lines 21-34).

Re claim 49, Saylor further teaches wherein the security gateway is further configured to detect if connectivity with the security system server through the first network is lost and notify the security system server through the second network of the loss of connectivity through the first network (col. 6, lines 21-34).

Re claim 50, Saylor further teaches wherein the security gateway is further configured to detect if connectivity with the security system server through the first network is lost and notify the security system server through the second network of the loss of connectivity through the first network (col. 6, lines 21-34).

Re claim 51, Saylor further teaches wherein the security gateway is further configured to notify the security system server in the event that connectivity with the security system server through the first network is lost while the security gateway is disarmed and the security gateway is armed before connectivity with the security system server through the first network is restored (col. 6, lines 21-55).

Re claim 52, Saylor further teaches wherein the security gateway is further configured to detect if connectivity with the security system server through the first network is lost and notify the security system server through the second network of the loss of connectivity through the first network (col. 6, lines 21-55).

Re claim 57, Saylor further teaches a security system (fig. 1) comprising: a security gateway located at a premises (110, 120, 112, 122, 114, 124 of fig. 1), wherein the security gateway is operable to detect an alarm condition and to record video of at least a portion of the premises relating to the alarm condition, the video hereinafter referred to as an Alarm Video; a security system server (130 of fig. 1) operatively coupled to the security gateway through a first

network, wherein the security gateway is configured to notify the security system server of the alarm condition and to transfer the Alarm Video to the security system server through the first network in substantially real time and wherein the security system server is remotely located relative to the security gateway (Note the connections between the security server and the property would obviously be considered as a first network, see 110, 130 of fig. 1)); a monitoring center (160 of fig. 1) operatively coupled to said security gateway through a second network (150 of fig. 1), wherein the security gateway is configured to notify the monitoring center of the alarm condition through the second network, wherein the monitoring center (160 of fig. 1) is remotely located relative to the security gateway and the security system server and wherein the monitoring center is further operably coupled to the security system server (130 of fig. 1); and wherein the monitoring center is configured to notify the security system server of the alarm condition (160 of fig. 1).

Re claim 58, Saylor further discloses wherein the monitoring center is operatively coupled to the security system server (130 of fig. 1) through a third network (152 of fig. 1) and wherein the monitoring center is configured to notify the security system server of the alarm condition through the third network.

Re claim 59, Saylor further teaches wherein the security system gateway is configured to notify the security gateway of the alarm condition through the first network substantially simultaneously with notifying the monitoring station of the alarm condition through the second network (col. 1, lines 5-13).

Re claim 60, Saylor further teaches wherein the monitoring center (160 of fig. 1) is operatively coupled to the security system server (130 of fig. 1) through the first network

(Internet) and wherein the monitoring center is configured to notify the security system server of the alarm condition through the first network.

Re claim 61, Saylor further teaches wherein the security system gateway (110 and 120 of fig. 1) is configured to notify the security gateway of the alarm condition through the first network substantially simultaneously with notifying the monitoring station of the alarm condition through the second network (col. 1, lines 5-13)).

Conclusion

7. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Powel (US 7,126,473) discloses intrusion detection and secure remote alarm communication system for a security system for the inactive storage of the active ingredients of weapons of mass destruction.

Contact Information

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Tung Vo whose telephone number is 571-272-7340. The examiner can normally be reached on Monday-Wednesday, Friday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Mehrdad Dastouri can be reached on 571-272-7418. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
